

LegalEase

AI-Powered Legal Document Generator

Phase 7: Project Documentation

Project Report

1. Purpose of This Phase

The Documentation phase consolidates all project knowledge — requirements, design, development details, and testing results — into structured documents that support maintenance, onboarding, and end-user adoption of LegalEase.

2. Types of Documentation Prepared

Document	Purpose
Software Requirements Specification (SRS)	Formal record of functional and non-functional requirements
System Design Document (SDD)	Architecture, database schema, and module design details
User Manual	Step-by-step guide for end users to generate and export documents
Technical/Developer Guide	Setup instructions, API reference, and codebase overview
Test Report	Summary of test cases executed and defect resolution status
Project Report	Overall summary covering all phases from ideation to demonstration

3. User Manual — Key Sections

- Getting Started:** How to register, log in, and navigate the dashboard.
- Generating a Document:** Selecting a category, entering requirements, and reviewing the AI draft.
- Editing a Draft:** Using the in-browser editor to modify clauses and wording.
- Exporting a Document:** Downloading the finished document as PDF or Word.
- Managing History:** Viewing, re-opening, and re-downloading past documents.
- Troubleshooting:** Common issues (e.g., missing fields, generation errors) and how to resolve them.

4. Technical Documentation — Key Sections

- System architecture overview with layer descriptions.
- Database schema with entity descriptions and relationships.
- API endpoint reference (method, path, request/response format) for each module.
- Setup and deployment instructions, including environment variables and dependencies.
- Description of the AI/NLP pipeline: input processing, generation, and clause validation.

5. Documentation Standards Followed

- Consistent heading structure and numbering across all documents.
- Diagrams and tables used to summarize architecture, schema, and workflows for clarity.
- Version labeling on each document to track updates during the project lifecycle.
- Plain, jargon-free language in the User Manual to suit non-technical readers.

6. Tools Used for Documentation

- Word processing / markdown tools for drafting reports and manuals.
- Diagramming tools for architecture, ER, and sequence diagrams.
- Shared repository/drive for version-controlled storage of all documentation.

7. Review and Sign-off Process

Each document was reviewed internally by the team for accuracy and completeness, then shared with the project mentor/guide for feedback. Revisions were incorporated before final sign-off, ensuring the documentation accurately reflects the delivered system.

8. Document Version Control

All documentation files are stored in the shared project repository alongside the source code, with version numbers and last-updated dates recorded on each document so that reviewers always reference the most current version.

9. Documentation Challenges

- Keeping the technical documentation synchronized with rapid changes during active development sprints.
- Writing the user manual in language simple enough for non-technical users while remaining precise.
- Ensuring diagrams (architecture, ER, sequence) stayed consistent with the final implemented design.

10. Documentation Deliverables Checklist

Deliverable	Status
Software Requirements Specification (SRS)	Completed

Deliverable	Status
System Design Document (SDD)	Completed
User Manual	Completed
Technical/Developer Guide	Completed
Test Report	Completed
Final Project Report	Completed

11. Handover Considerations

The technical documentation and codebase comments are written with future maintainers in mind, so that a new developer joining the project could understand the architecture, set up the development environment, and locate the relevant module for a given feature without needing direct guidance from the original team.

12. Maintenance Guidelines

- New document templates should be added through the Template Manager without modifying core generation logic, preserving separation between content and processing code.
- Any change to mandatory clause rules must be reflected in the Clause Validator and covered by an updated test case.
- The User Manual should be revisited whenever a user-facing workflow changes, to keep end-user guidance accurate.

13. Documentation Timeline

Documentation was drafted incrementally alongside development rather than solely at the end of the project: requirement and design documents were written during their respective phases, while the user manual and technical guide were finalized once the feature set was stable, reducing the risk of documentation drifting away from the actual delivered system.

14. Accessibility of Documentation

All documents are stored in commonly accessible formats and organized within a shared folder structure grouped by phase, so that any team member, evaluator, or future contributor can locate the requirements, design, user, or technical documentation without needing a guided walkthrough.

15. Outcome of This Phase

A complete set of documentation — covering requirements, design, user guidance, and technical reference — is produced, supporting both the final demonstration and any future maintenance or handover of the LegalEase project.
